

# YoDA ImageJ workshop: Take your image analysis to the next level

ImageJ (or Fiji) is an open-source image analysis software with an amazing number of possibilities. In this workshop, we'll explore some of the functions that are helpful to advance and automate your image analysis, including:

- How to automate analyses across many images/entire folders
- Using tables to automatically organize results
- Manual interaction/input in an automated analysis setup
- Leveraging the ROI manager for e.g. single-cell or subcellular analyses
- Extended particle analyzer and other specialized measuring tools

The workshop will focus on tricks and tools that are generally applicable across many different subfields and types of image analysis – so **bring your lab mate** and your **laptop with ImageJ (or, even better, Fiji) installed!**

Download Fiji here:  
<https://imagej.net/software/fiji/downloads>

Coffee/tea & cake  
will be served!
